

GAWA GHEE B2B WEBSITE

Production Readiness Document & Launch Checklist

Project:	Gawa Ghee Static Website Framework (v1.3)
Client:	Ghosh Dairy Farm
Author:	B2B Vendor Development Team
Status:	Draft / Pending Client Assets
Staging URL:	https://s4suryalwaiting.github.io/gawa_ghee/

Executive Summary

This document serves as the official launch checklist and technical design blueprint required to transition the Gawa Ghee static website from its current staging environment to a live, production-ready release.

The current build is fully optimized for B2B search visibility, contains triple-channel floating contact hooks, is structured for local schema SEO criteria, and runs staggered slide-up animations. However, before the website can be deployed under the client's official domain name, several placeholders must be replaced with verified assets, and the Google Sheets database backend must be wired up.

1. Content & Placement Audit (Official Data Collection)

The following placeholders are currently configured with mock values. The client must supply official values to avoid publishing invalid data:

Placeholder Field	Current Mock Value	Required Production Data
Direct Phone Line	+91 00000 00000	Official B2B enquiry line for corporate bulk buyers.
WhatsApp Contact	tel: +91 00000 00000	Active WhatsApp Business number (for direct message intake).
Corporate Email	b2b@gawaghee.com	Monitored inbox (e.g., enquiry@gawaghee.com).
Physical HQ Address	Ghosh Dairy Farm HQ	Detailed street address, office suite, and PIN/ZIP code.

Placeholder Field	Current Mock Value	Required Production Data
FSSAI Registration	Text Only: "FSSAI Registered"	Client's official 14-digit registration license number.
ISO Registration	Text Only: "ISO 9001:2015"	Active certificate registration numbers (if applicable).

2. Missing Client Media Assets

All design dimensions are complete, but image assets are currently loaded from placeholder files. The client must supply high-resolution, professional photography matching the brand's premium color scheme:

- **Hero Banner Pack Shot (1200 x 800px):** High-resolution, photorealistic image of the Gawa Ghee product family (Jar, 1L Tin, 15kg Tin) sitting on a premium background.
- **Product SKU Visuals (600 x 600px):** Individual pack shots of:
 - Premium Danadar Gawa Ghee (500g Jar)
 - Classic Pure Cow Ghee (1L Tin)
 - Commercial Kitchen Supply (15kg Tin)
- **Dairy Farm Sunrise Visual (1000 x 600px):** Landscape image of West Bengal dairy farms (used on Home and Our Story pages).
- **Automated Facility Visual (1000 x 600px):** Image of the high-tech processing facility showing scales and hygiene controls (used on Home page).

3. Backend Integration (Google Sheets via Apps Script)

To preserve the serverless, lightweight nature of the static website, the B2B intake form on `contact.html` will be connected directly to a Google Sheets database using Google Apps Script.

Step-by-Step Implementation Blueprint

1. Create a new Google Sheet named "**Gawa Ghee B2B Leads**".
2. Open **Extensions > Apps Script**, clear the editor, and paste the following script:

```
function doPost(e) {
  try {
    var sheet = SpreadsheetApp.getActiveSpreadsheet().getActiveSheet();
    var data = JSON.parse(e.postData.contents);

    // Append form data to the next available row
    sheet.appendRow([
      new Date(),
      data.fullName,
      data.companyName,
      data.phone,
      data.email,
      data.operationType,
      data.requirementContext
    ]);
  }
}
```

```
        return ContentService.createTextOutput(JSON.stringify({ "result": "success" }))
            .setMimeType(ContentService.MimeType.JSON);
    } catch (error) {
        return ContentService.createTextOutput(JSON.stringify({ "result": "error", "message":
error.toString() }))
            .setMimeType(ContentService.MimeType.JSON);
    }
}
```

3. Click **Deploy > New Deployment**.

4. Select type: **Web App**. Set "Execute As" to **Me (your-email)** and "Who has access" to **Anyone**.

5. Copy the generated **Web App URL**.

6. Update `js/main.js` on line 125, replacing the endpoint parameter with the new URL:

```
const endpoint = "YOUR_GOOGLE_APPS_SCRIPT_WEB_APP_URL";
```

 **Crucial Production Note:** Ensure that the form handler in `js/main.js` uses standard `fetch()` with CORS mode enabled, and updates the submit button text dynamically to indicate progress.

4. Production Deployment & Domain Mapping Plan

To launch the website live under the client's official domain name (e.g., `gawaghee.com`), the following steps must be completed:

Hosting & DNS Setup

- **Choose Hosting Host:** Recommend GitHub Pages, Netlify, or Vercel for fast, global CDN delivery.
- **Configure DNS:** Add custom ALIAS/CNAME records in the domain's registrar dashboard (GoDaddy, Namecheap, etc.):
 - CNAME record mapping `www.gawaghee.com` to `s4surya1swaiting.github.io`.
 - A records mapping root domain `gawaghee.com` to the hosting provider's IP addresses.
- **SSL Certification:** Enforce HTTPS globally. GitHub Pages automatically provisions a Let's Encrypt SSL certificate once DNS propagation is complete.

Search Engine Optimization (SEO) & Launch Checklist

1. Verify the presence of `robots.txt` in the root directory to permit search engine indexation.
2. Generate a valid `sitemap.xml` mapping the 4 core pages: Home, Products, Our Story, and Contact Us.
3. Verify indexation via Google Search Console by uploading the sitemap.
4. Enable tracking hooks by replacing placeholder Google Analytics G-IDs in the header scripts of all 4 HTML pages.
